

import JSON files in ES modules (Node.js)

```
// An import assertion in a static import
import info from './package.json' assert { type: 'json' };

// An import assertion in a dynamic import
const { default: info } = await import('./package.json', {
  assert: {
    type: 'json',
  },
});
```

Option 1: Read and parse JSON files yourself

The Node.js documentation advises to use the `fs` module and do the work of reading the files and parsing it yourself.

```
import { readFile } from 'fs/promises';

const json = JSON.parse(

  await readFile(

    new URL('./some-file.json', import.meta.url)

  )

);
```

Option 2: Leverage the CommonJS `require` function to load JSON files

`createRequire` allows you to construct a CommonJS `require` function to use typical CommonJS features such as reading JSON in your Node.js EcmaScript modules.

```
import { createRequire } from "module";

const require = createRequire(import.meta.url);

const data = require("./data.json");
```

Example-1

Method 1: Using `require` method:

A straightforward way to read a JSON file in a Node JS file is by using the ``require()`` method to include it.

Syntax:

```
const data = require('path/to/file/filename');
```

Example: Create a **users.json** file in the same directory where **index.js** file present. Add following data to the **users.json** file and write the **index.js** file code:

JSON

```
[
{
    "name": "John",
```

```
    "age": 21,  
    "language": ["JavaScript", "PHP", "Python"]  
  },  
  {  
    "name": "Smith",  
    "age": 25,  
    "language": ["PHP", "Go", "JavaScript"]  
  }  
]
```

Js code:

```
// Requiring users file  
const users = require("./users");
```

```
console.log(users);
```

To run the file using the command:

```
node index.js
```

```
Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$ node index.js
[ { name: 'John',
  age: 21,
  language: [ 'JavaScript', 'PHP', 'Python' ] },
  { name: 'Smith',
    age: 25,
    language: [ 'PHP', 'Go', 'JavaScript' ] } ]

Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$
```

Method 2: Using the fs module:

```
const fs = require("fs");

// Read users.json file
fs.readFile("users.json", function(err, data) {

    // Check for errors
    if (err) throw err;

    // Converting to JSON
    const users = JSON.parse(data);
    console.log(users); // Print users
});
```

```
Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$ node index.js
[ { name: 'John',
  age: 21,
  language: [ 'JavaScript', 'PHP', 'Python' ] },
  { name: 'Smith',
    age: 25,
    language: [ 'PHP', 'Go', 'JavaScript' ] } ]

Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$
```

Writing to a JSON file

We can write data into a JSON file by using the nodejs **fs** module. We can use **writeFile** method to write data into a file.

Syntax:

```
fs.writeFile("filename", data, callback);
```

Example: We will add a new user to the existing JSON file, we have created in the previous example. This task will be completed in three steps:

- Read the file using one of the above methods.
- Add the data using `.push()` method.
- Write the new data to the file using [`JSON.stringify\(\)`](#) method to convert data into string.

INDEX.js

```
const fs = require("fs");

// STEP 1: Reading JSON file
const users = require("./users");

// Defining new user
let user =
{
  name: "New User",
  age: 30,
  language: ["PHP", "Go", "JavaScript"]
};

// STEP 2: Adding new data to users object
users.push(user);

// STEP 3: Writing to a file
fs.writeFile(
  "users.json",
  JSON.stringify(users),
  err => {
    // Checking for errors
    if (err) throw err;
```

```
// Success
console.log("Done writing");
});
```

Output: Run the file again and you will see a message into the console:

```
Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$ node index.js
Done writing

Lenovo@DESKTOP-6NPSGPK MINGW64 /d/Projects/random/node-json
$
```

Now check your **users.json** file it will look something like below:

```
{ } users.json > ...
1  [
2    { "name": "John", "age": 21, "language": ["JavaScript", "PHP", "Python"] },
3    { "name": "Smith", "age": 25, "language": ["PHP", "Go", "JavaScript"] },
4    { "name": "New User", "age": 30, "language": ["PHP", "Go", "JavaScript"] }
5  ]
6
```
